Risk Scoring System

In order to assess the relative importance of health and safety risks and to enable corrective action to be prioritised, a simple system of scoring has been used.

The Risk Score reflect the combination of the Severity of Hazard and the Likelihood of Occurrence.

$$\text{RISK SCORE} = \text{SEVERITY OF HARM} \times \text{LIKELIHOOD OF OCCURRENCE}$$

Severity of Harm – the potential to cause harm will vary in severity. The effect of a hazard has been rated as follows:

Fatal/ Major eg. death or major injury

Over 3-day eg. injuries where people may be off work for more than 3 days

Minor eg. all other injuries including those where people are off work for periods of up to 3 days

Likelihood of Occurrence (of Harm) – Harm may not occur in every case, this will be affected by a number of factors, including the organisation of the work, measures in place to control risk and, the nature and extent of exposure to the hazard. The likelihood of occurrence has been rated as follows:

Certain eg. where it is certain or near certain that harm will occur

Possible eg. where harm will occur frequently

Unlikely eg. where harm will seldom occur

Risk Evaluation Matrix

Likelihood of Occurrence		Severity of Harm		
		Fatal/Major	Over 3 day	Minor
Certain	Imminent	High	Medium	
Possible	High	Medium	Low	
Unlikely	Medium	Low	Low	

Remedial Action Timetable

	Imminent Risk	High Risk	Medium Risk	Low Risk
Remedial Action to eliminate or reduce risk	Immediate action	Action as a matter of priority	Action as soon as is practicable	Action as a part of programmed risk management procedures
